

Week 4 Verification Report

Student: Akshay

Project: Node.js & Express Backend Development

Objectives Completed

- Configured SQLite database connection.
- Created and executed users table migration.
- Implemented User model.
- Built Register API with bcrypt password hashing.
- Built Login API with JWT token generation.
- Implemented JWT authentication middleware.
- Protected /api/auth/profile route using Bearer token.
- Verified successful registration, login, and protected route access.
- Created database documentation (docs/database.md).
- Updated README.md with setup instructions and API documentation.

Testing Summary

All implemented endpoints were tested using Thunder Client. Registration, login, JWT generation, and protected route authentication worked successfully.

Conclusion

Week 4 requirements were successfully implemented and verified. The backend now supports secure user authentication using JWT with SQLite for data storage.
